

# A Construction company gains Employee Response Form with Power Platform

## ***What was their business problem?***

During the height of the COVID-19 pandemic our client needed a solution that would help guide employees with their corporate policies for reporting that constantly changed due to health regulations.

## ***What was our solution to solve the problem?***

We solved this problem in an incremental fashion, starting initially with a Microsoft Form based solution and Power Automate to securely determine what the demographic make-up of the company was when it came to vaccinations.

## ***What are the results/outcomes?***

The solution is still active after a year and has been further enhanced to accommodate other health guidelines that our client wanted to enforce.

The next step was to create a PowerApp solution based on the criteria of current health, exposure circumstances & current regulations gathered from the employee. The Solution would then offer company guidance on next steps, such as, how long they needed to stay on PTO and if they needed to wait 'X' number of days to be tested again. The ability to quickly change the conditional logic of the form based on the criteria of the ever-changing regulations was realized over and over during the past year. The enhanced features over a Microsoft Form with the simplicity of a low-code solution allowed the changes to be made within a 24- hour period with very low risk.
